QUALITY PARTS

HYDRAULIC RELEASE BEARING

TS 16949

Provide quality products and trustworthy services to global auto parts consumers

COMPANY PROFILE

Hangzhou DUHUI Auto Parts Co., Ltd. was established in 2003 and is located in Xiaoshan District Economic Development Zone, Hangzhou City. The company integrates supply chain development, quality management, warehousing, business operations, and other management capabilities, and is built through an information system to provide customers with one-stop services product solutions.

DUHUI has been focusing on automotive bearings for 20+ years, it mainly produces wheel hub, wheel bearing, release bearing, tensioner, etc., covering more than 4,000+ auto parts models, including all mainstream models on the market.

QUALITY CONTROL

We have installed a complete line of international-advanced production equipments and implemented fabrication technology. The equipments include SIGMA numerically controlled lathe Durability Test Machine, etc.

TESTING CENTER

We installed a complete international-advanced testing and examining equipments to ensure the quality of our products. Our Quality Department strictly test each unit according to ISO/TS standards.

INTRODUCTION

Release Bearing:

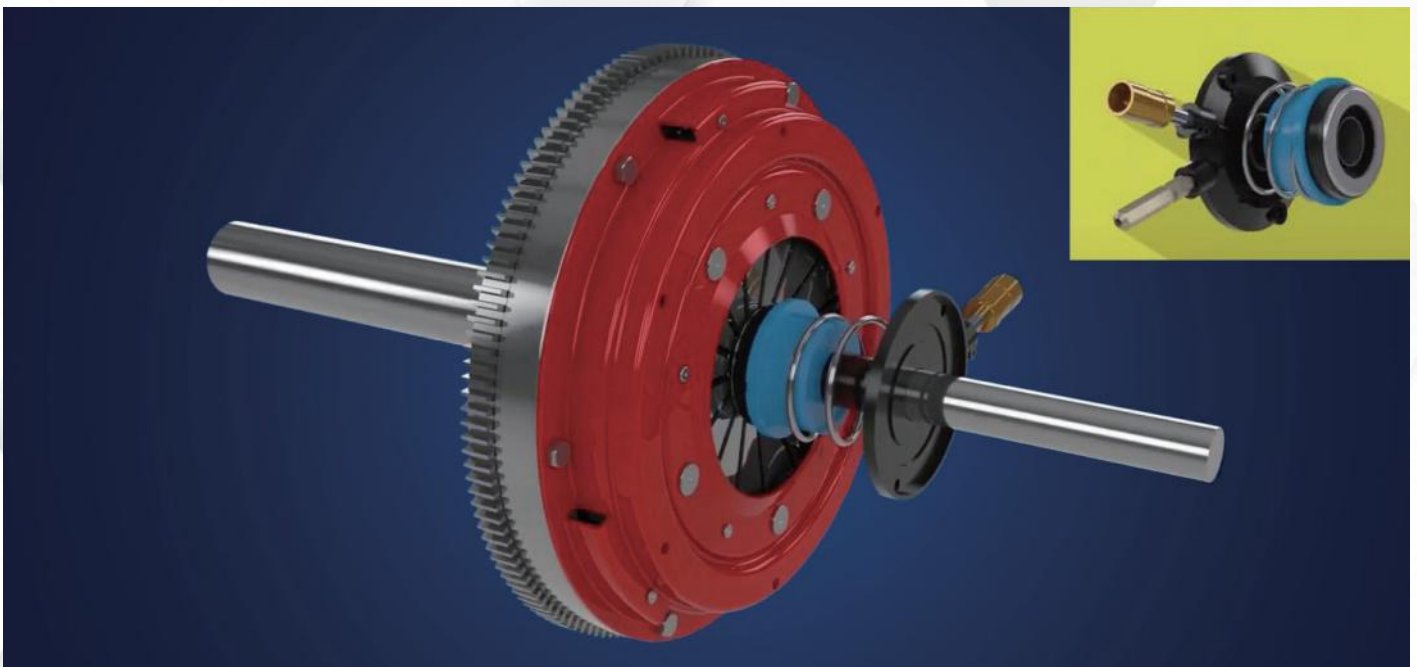

The release bearing is an important component in the automobile clutch and is usually installed between the clutch and transmission. Its main function is to separate the clutch pressure plate and clutch friction plate when the clutch is disengaged, thereby achieving the separation of the engine and transmission.

The working principle of the release bearing is to realize the connection or disconnection between the automobile engine and the transmission system through the axial movement of the bearing. In operations such as starting, shifting, and parking the car, the release bearing plays a vital role. It can make the car start, shift, and stop smoothly, and it also plays a certain protective role in overloading the car's transmission system.

Automobile Clutch:

Automobile clutches can be divided into mechanical clutches, hydraulic clutches, electromagnetic clutches and pneumatic clutches according to their driving methods.

Hydraulic clutch: A hydraulic clutch transmits clutch operating force through a hydraulic system. Hydraulic clutches are typically lighter and require less operating force because the hydraulic system can provide a greater leverage ratio.

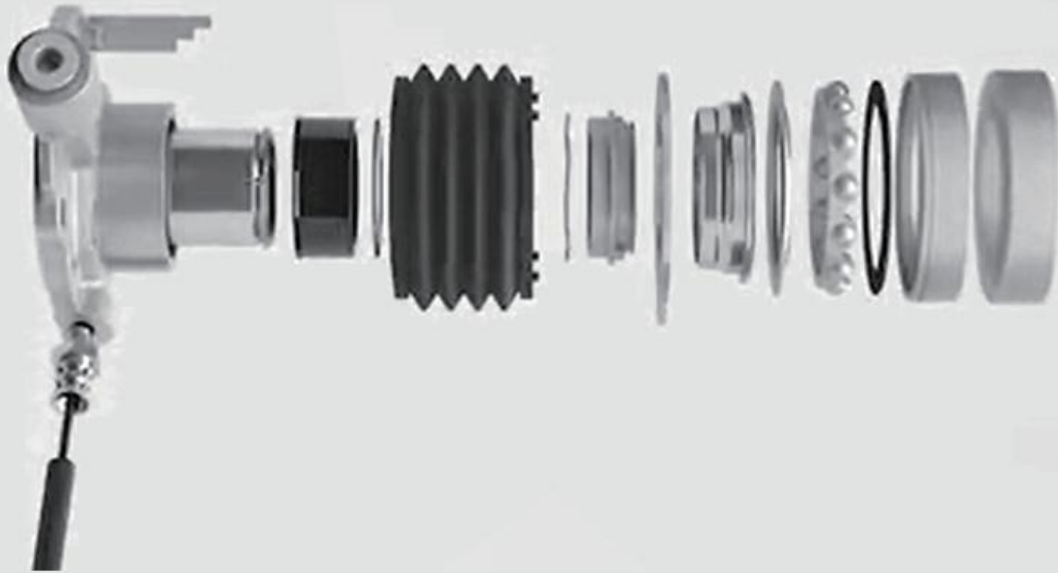

Hydraulic Clutch Release Bearing

The clutch release bearing realizes clutch separation and engagement under the action of fluid pressure.

In a hydraulic clutch system, the release bearing is usually located above or inside the piston of the clutch cylinder, adjacent to the pressure plate. The function of this bearing is similar to the release bearing in a mechanical clutch, which is used to separate the connection between the pressure plate and the engine.

BASIC STRUCTURE

Hydraulic release bearings rely more on the pressure generated by the liquid medium to achieve bearing separation.

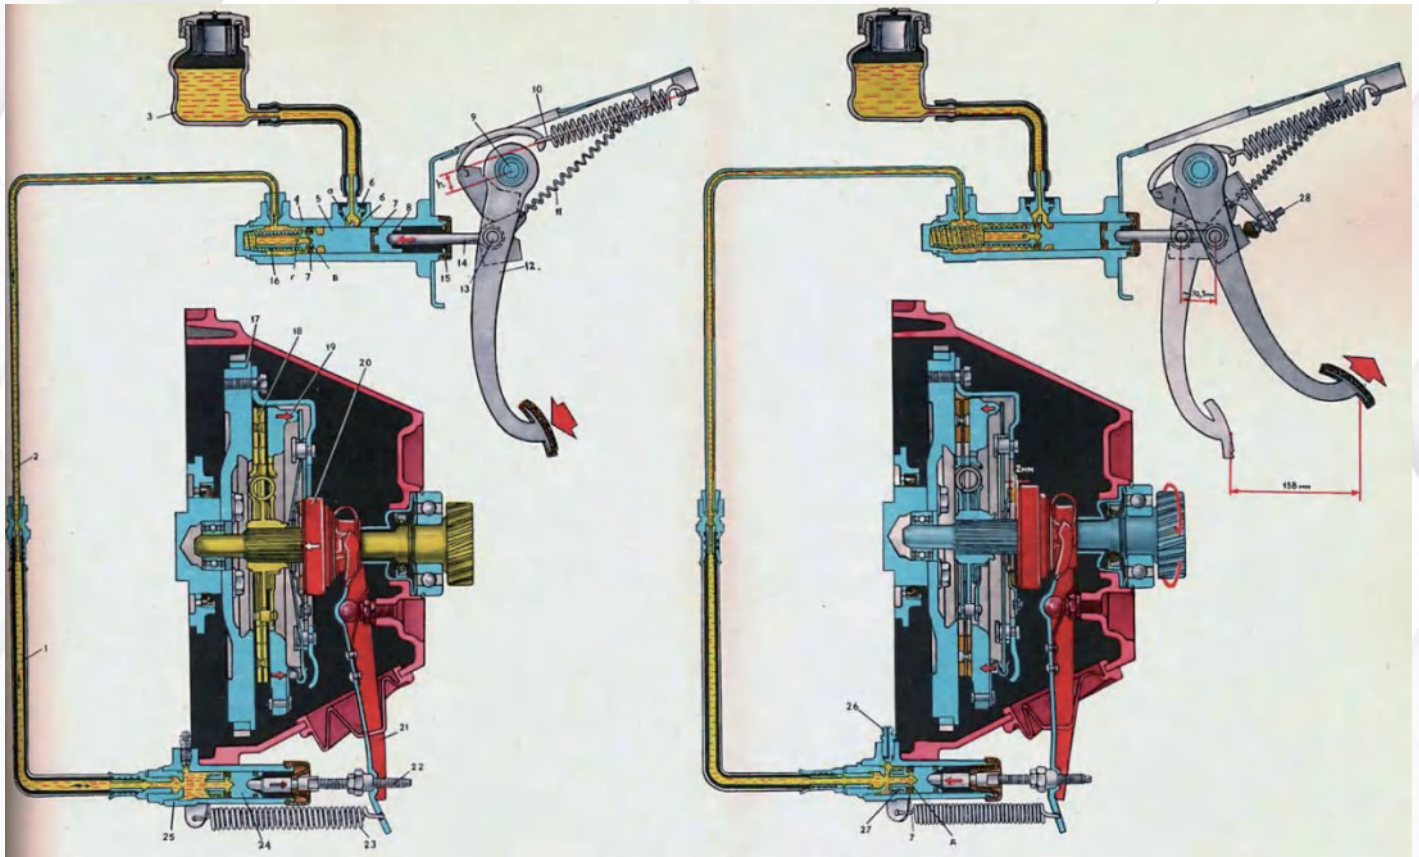

Inner and outer rings : The inner and outer rings are usually made of metal and are used to support and position the rolling elements in the bearing.

Rolling elements: Usually needle rollers, balls or rollers, etc., used to roll between the inner and outer rings to reduce friction.

Hydraulic chamber: The hydraulic chamber is one of the core components of the hydraulic release bearing, which is filled with liquid medium (such as hydraulic oil). When the liquid medium is under pressure, a pressure area is formed inside the bearing, which separates the rolling elements from the raceway, thereby reducing friction and wear.

Sealing device: Used to keep the liquid in the hydraulic chamber from leaking and prevent external contaminants from entering the inside of the bearing.

WORKING PRINCIPLE

The working principle of the hydraulic release bearing is to transmit pressure and control the separation and combination of the clutch through the hydraulic system. When the clutch pedal is depressed, the hydraulic system generates oil pressure, which transmits pressure through the hydraulic oil and pushes the piston to move, causing the pressure plate to separate or combine with the engine crankshaft.

Hydraulic release bearings have the advantages of fast response, high precision, and light operation, but they require regular maintenance and upkeep to ensure their normal operation.

Connected state: When the hydraulic clutch is in the connected state, the hydraulic system applies hydraulic pressure to the clutch hydraulic cylinder, which causes the piston in the hydraulic cylinder to apply force to the pressure plate, connecting the pressure plate and the flywheel together, thereby realizing the connection between the engine and the transmission.

Disengagement state: When the driver needs to separate the engine and transmission, the hydraulic system will reduce or interrupt the hydraulic pressure applied to the clutch hydraulic cylinder. This causes the piston in the clutch hydraulic cylinder to reduce the force or move to a position that separates the pressure plate from the engine and stops power transmission.
