

DUHUI

QUALITY PARTS

OIL SEAL

TS 16949

Provide quality products and trustworthy services to global auto parts consumers

# COMPANY PROFILE

Hangzhou DUHUI Auto Parts Co., Ltd. was established in 2003 and is located in Xiaoshan District Economic Development Zone, Hangzhou City. The company integrates supply chain development, quality management, warehousing, business operations, and other management capabilities, and is built through an information system to provide customers with one-stop services product solutions.

DUHUI has been focusing on automotive bearings for 20+ years, it mainly produces wheel hub, wheel bearing, release bearing, oil seal, etc., covering more than 4,000+ auto parts models, including all mainstream models on the market.

## QUALITY CONTROL

We have installed a complete line of international-advanced production equipments and implemented fabrication technology. The equipments include SIGMA numerically controlled lathe Durability Test Machine, etc.

## TESTING CENTER

We installed a complete international-advanced testing and examining equipments to ensure the quality of our products. Our Quality Department strictly test each unit according to ISO/TS standards.

# OIL SEAL

## Function

Oil seal is a commonly used mechanical component. A good bearing needs to have excellent sealing performance during use, and the bearing sealing device plays an important role. It can not only effectively prevent external dust, moisture or other foreign matter from invading the bearing internally, thereby affecting bearing life; it can also prevent lubricant leakage.

### 1. Protect bearings

Prevent external dust, dirt, metal particles, moisture, acid gas and other debris from intruding into the inside of the bearing. If the bearing seal is poor and external debris invades, the working condition of the bearing will significantly deteriorate, and the service life of the bearing will be significantly reduced.

### 2. Prevent grease leakage

If oil leaks, it will quickly destroy the normal lubrication of the bearing and cause the bearing to burn out due to heat. In addition, poor sealing devices not only cause waste due to oil leakage, but also contaminate mechanical equipment and processed products. Therefore, for the machine to operate normally, the bearings must have good sealing devices.

## Types

Oil seal can be divided into two categories: self-contained seals and external seals.

### 1. Comes with seal

The so-called bearing comes with a sealing device, which means that the bearing itself is made into a device with sealing performance. Such as bearings with dust covers, sealing rings, etc. This kind of seal takes up very little space, is easy to install and disassemble, and has a relatively low cost.

### 2. Additional sealing

The so-called bearing external sealing performance device is a sealing device with various performances made inside the installation end cover. External seals are divided into two types: non-contact and contact:

#### 1) Contact sealing

A contact seal is a seal that is in contact with its relatively moving parts without gaps. Due to the direct contact between the seal and the mating parts, this type of seal has greater friction and heat generation during operation, which can easily lead to poor lubrication and easy wear of the contact surface, resulting in a decrease in sealing effect and performance. Therefore, it is only suitable for medium and low speed working conditions. Commonly used contact seals include felt seals, cup seals and other structural forms, which are used in different occasions. The contact area between the shaft and seal needs to be lubricated, usually with the same lubricant as the bearing.

Contact sealing devices mainly include: Z-shaped sealing rings, V-shaped sealing rings, oil seals, etc.

#### 2) Non-contact sealing

Non-contact seal is a seal that does not contact the relative moving parts and has an appropriate gap. This form of seal generates almost no frictional heat and no wear during operation, and is especially suitable for high-speed and high-temperature applications. Non-contact seals are commonly used in various structural forms such as gap type, labyrinth type and gasket type, which are used in different occasions. The gap of the non-contact seal should be as small as possible.

Non-contact sealing devices mainly include: gap seal, oil groove seal, labyrinth seal, oil slinger, etc.

### 3. Hybrid seal

In harsh environments such as dust and moisture, and in situations where lubricant leakage is not allowed, various sealing forms are often used in combination to achieve better sealing effects.

CODE	MEANING		EXAMPLE
Z	One side	With dust cover	6210-Z
2Z	Both sides		6210-2Z
FS	One side	With felt ring seal	6203-FS
2FS	Both sides		6203-2FS
RS	One side	With skeleton rubber seal	Contact type 6210-RS
2RS	Both sides		Contact type 6210-2RS
LS	One side		Contact type, ferrule not slotted 6210-LS
2LS	Both sides		Contact type, ferrule not slotted 6210-2LS
RZ	One side		Non-Contact 6210-RZ
2RZ	Both sides		Non-Contact 6210-2RZ
RSZ	One side with skeleton rubber seal		Contact type 6210-RSZ
RZZ			Other side with dust cover Non-Contact 6210-RZZ
R	The outer ring of the bearing has a stop rib (flange outer ring) (Not applicable to radial ball bearings with inner diameter less than 10mm)		30307R
N	There is a stop groove on the bearing outer ring		6210N
NR	There is a stop groove on the outer ring of the bearing and a stop ring.		6210NR
ZN	One side with dust cover	The outer ring on the other side has a stop groove	6210-ZN
ZNR		The outer ring on the other side has a stop groove and a stop ring.	6210-ZNR
ZNB		The outer ring has a stop groove on the same side	6210-ZNB
2ZN	Both side with dust cover	The outer ring has a stop groove	6210-2ZN
PP	Both sides	With soft rubber seal	NATR8PP
